

JUMP INDEX: UNDER 3 & UNDER 4 STRATEGY

GUIDE USING D-CIRCLES ANALYSIS

Strategy Author: Georgetown (Georgetown Digits Flow)

Market: Jump Index (Deriv Synthetic Indices)

Primary Focus: Under 3 & Under 4 (Digit Predictions)

Data Snapshot: Last 1000 Ticks (Drafted and analyzed from real time market)

SECTION 1: THE MARKET ANALYSIS (JUMP 10, 25, 50, 75 and 100 INDEX)

On **26th February 2026**, the Jump 10 Index was analyzed over the last **1000 ticks**. The digit distribution revealed a **clear statistical imbalance** favoring the lower digits, particularly 0, 1, 2, and 3.

Digit Distribution Summary (Last 1000 Ticks)

Digit	Frequency (%)	Momentum
0	10.5%	✅ Strong / Valid
1	10.6%	✅ Strong / Valid
2	10.9%	✅ Strong / Valid
3	8.8%	⚠️ Moderate / Valid
4	10.0%	✅ Strong / Valid
5	9.6%	Neutral
6	9.7%	Neutral
7	9.7%	Neutral
8	9.8%	Neutral
9	10.4%	Neutral

Key Insight for Traders

- The **Under 4 Market** (Digits 0,1,2,3) shows a **combined frequency of approximately 40.8%** , which is a slight but significant edge over the statistical norm of 40% over infinite ticks.
- Within this group, digits **0, 1, and 2** are performing above their expected 10% average, making them the strongest candidates.
- Digit **3** is slightly underperforming but still contributes to the overall "Under" strength.
- This indicates a **short-term statistical bias** towards the lower digits, likely to persist for a series of upcoming ticks before reverting to the mean.

SECTION 2: THE STRATEGY FRAMEWORK

This strategy is built on the **Confluence Model** I developed: combining digit momentum, group analysis, and price confirmation.

Core Principle

We do not predict. We identify **short-term statistical imbalances** and ride them with strict discipline.

Market Focus

- **Primary:** Under 4 (Digits 0, 1, 2, 3)
- **Secondary:** Under 3 (Digits 0, 1, 2) – A tighter, higher-probability filter within the Under 4 group.

SECTION 3: ENTRY CONDITIONS (YOUR "A+ SETUP")

For a trade to be considered valid on the Jump 10 Index, **ALL** the following conditions must be met.

Condition A: Digit Circle Analysis (The "Green Bar" Rule)

- **For Under 4 Trades:** At least **3 of the 4 digits** in the Under group (0, 1, 2, 3) must display **GREEN momentum bars** on the Digit Circle Analysis tool.
- **For Under 3 Trades (Higher Probability):** At least **2 of the 3 digits** (0, 1, 2) must display **GREEN momentum bars**, with the third digit being neutral (not red).
- **The "No Red" Rule:** The target digits should **not** have strong red bars. A single red bar among the group weakens the signal significantly.

Condition B: Percentage Confirmation

- The individual percentage for each target digit should be **at or above 10.0%** in the current window.
- The **total group percentage** (e.g., 0+1+2+3) should be trending **upwards** over the last 50-100 ticks.

Condition C: Price Action Confirmation (The Chart Check)

- The Jump 10 Index's **1-second price chart** must be in a **micro-downtrend** (making lower highs and lower lows). This confirms that the price movement is aligned with the lower digit bias.
- **Crucial Rule:** If the price chart is moving up (uptrend), **DO NOT TRADE UNDER.** The probability shifts against you.

Condition D: Opposite Group Status

- The opposing digits (4,5,6,7,8,9) should show **mixed or weak momentum** (red bars or low percentages). If the Over group is also showing strong green momentum, the market is conflicted, and you should stay out.

🎯 SECTION 4: EXECUTION RULES

Trade Parameters (Fixed)

Parameter	Setting
Market	Jump 10 Index
Contract Type	Digit Over/Under
Prediction	Under 4 or Under 3

Duration	5-10 ticks (scalp) or 1 minute (swing)
Stake	FIXED (e.g., \$1 or 1% of capital). Never change.
Stop-Loss	MANDATORY. Exit if the trade moves against you by 3-4 ticks OR if the digit momentum bars for your group turn red.

Profit Target & Exit

Scenario	Action
Trade goes in your favor	Exit after 5-10 ticks or when the momentum bars for your group start showing the first signs of red.
Trade hits stop-loss	Accept the loss. Close the platform for a mandatory 30-minute break . No exceptions.
Session target reached	If you hit your 2-4% profit target for the session, WITHDRAW THE PROFITS immediately and stop trading.

SECTION 5: PSYCHOLOGY & DISCIPLINE (From Georgetown Official Journal)

This strategy works **ONLY** if you follow these psychological rules:

Rule	Why It Matters
No Revenge Trading	After a loss, walk away. The market will be there tomorrow.

No Screenshots	Your success is measured by withdrawals, not balance numbers. Share only withdrawal slips.
Trade Only Your Sessions	Stick to your predefined session times (e.g., 5AM, 10AM, 2PM, 6PM). If you miss your window, wait for the next.
Close the Laptop	When your session ends, your profit target is hit, or your stop-loss is triggered, physically close the laptop . This action protects your capital from your own impulses.
Trust the Process	This strategy has an edge over thousands of ticks. Individual trades will lose. Trust the math, not your emotions.

SECTION 6: RISK MANAGEMENT SUMMARY

Concept	Rule
Per-Trade Risk	1% of session capital (fixed stake)
Per-Session Loss Limit	2-3% of session capital (if hit, stop trading)
Per-Session Profit Target	2-5% (if hit, withdraw and stop)
Daily Session Limit	Maximum 2-3 sessions per day (to prevent fatigue)
Withdrawal Rule	Always withdraw profits immediately after hitting target.

SECTION 7: FINAL CHECKLIST (BEFORE EACH TRADE)

Ask yourself these 5 questions before clicking "Buy":

1. Are 3 of the 4 Under digits (0,1,2,3) showing GREEN bars? ☐ Yes ☐ No
2. Is the 1-second price chart in a DOWNTrend? ☐ Yes ☐ No
3. Is my fixed stake set and stop-loss in place? ☐ Yes ☐ No
4. Am I trading during my scheduled session time? ☐ Yes ☐ No
5. Am I calm, disciplined, and not seeking revenge? ☐ Yes ☐ No

If ALL answers are YES, execute the trade.

If ANY answer is NO, close the laptop and wait.

SECTION 8: ABOUT THIS STRATEGY

This strategy was developed through live market analysis on **26th February 2026**, using the Jump 10 Index over a 1000-tick window. It is based on the core principles of **digit momentum**, **group analysis**, and **trader psychology** discussed extensively between Georgetown and his co-mentors.

Remember: Synthetic indices are generated by a Random Number Generator (RNG). This strategy identifies **short-term statistical imbalances**, not certainties. Consistent profits come from disciplined execution over hundreds of trades, not from winning every single trade.

Trade Smart. Stay Disciplined. Withdraw Often.
